

## Program installs but does not run

Posted by Iugus1 - 2010/08/04 15:05

---

Receive the following when I try and run the program.

Description:

Stopped working

Problem signature:

Problem Event Name: CLR20r3  
Problem Signature 01: auto blogging.exe  
Problem Signature 02: 1.0.0.0  
Problem Signature 03: 4c59192d  
Problem Signature 04: System  
Problem Signature 05: 2.0.0.0  
Problem Signature 06: 4a275e12  
Problem Signature 07: 2c79  
Problem Signature 08: 67  
Problem Signature 09: System.Net.Sockets.Socket  
OS Version: 6.1.7600.2.0.0.768.3  
Locale ID: 1033

The system is 64bit Windows7.

On another 64bit Windows7 system the program runs but then errors complaining it cannot find various files. For instance I add a blog and it pops an error message saying it cannot find the file xxxx.txt. When I check, it has created the new blogs directory with the category listing etc but will not find that new blog when I rerun the program.

Thank you

Any ideas.

Looks like a permission issue. Can you please try uninstalling the software and try installing it to a different folder other than program files folder.

Also, try opening the software by right-clicking on the program icon and choosing "Run as administrator" option and tell me if it works fine.

Regards,  
Carty..

Ok I have tried:

Different folders, different drives

As admin/as user

firewalls off/on

Made sure .net framework 3.5 was switched on in the control panel and tried it switched off

Run from the shortcut/run directly from its folder

Downloaded again just in case

etc and all the above in a thousand combinations.

It breaks the instant I run it

The following is what appears in the 'look for solution box':

Description:

Stopped working

Problem signature:

Problem Event Name: CLR20r3

Problem Signature 01: auto blogging.exe

Problem Signature 02: 1.0.0.0

Problem Signature 03: 4c59192d

Problem Signature 04: System

Problem Signature 05: 2.0.0.0

Problem Signature 06: 4a275e12

Problem Signature 07: 2c79

Problem Signature 08: 67

Problem Signature 09: System.Net.Sockets.Socket

OS Version: 6.1.7600.2.0.0.768.3

Locale ID: 1033

From my research it looks like a network error that occurs when the program runs. Does it attempt to make a http/tcp/udp connection the instant it starts and before the interface appears?

Yes, it checks for the latest version everytime you open the software. The same thing stricken to me when the error has .Net Sockets. Do you have some kind of an anti virus program blocking the requests?

Regards,

Carty..

All the combinations previously mentioned have been tried with and without anti-virus software.

Looks like I may have repaired the issue. I will post an update in a short while. Thank you.

OK turns out the some kind of weird bug had broken a small part of the .net framework which prevented the Auto Blog software from running but nothing else. Then the windows update service broke and compounded the issue. Luckily I found:

[download.microsoft.com/download/8/3/D/83DA9B2F-3246-4C1E-996B-1381F667247D/MicrosoftFixit50202.msi](http://download.microsoft.com/download/8/3/D/83DA9B2F-3246-4C1E-996B-1381F667247D/MicrosoftFixit50202.msi)

Which repaired the update service and allowed me to download the latest .Net Framework update. This cured the problem.

:P

Thank you, now I am off to play.
