

## FTP Images - What is wrong?

Posted by dangus - 2010/08/04 23:08

---

Hi

I managed to get 2 images uploaded, but then luck ran out. And as the software get stuck I just need to solve it.

I am using cPanel. So I created a new ftp:

Server: ftp.betscafe.com

User: images@betscafe.com

Password:\*\*\*\*\*

http://www.betscafe.com/images/

What can be wrong?

Please create an empty text file in the Install folder of the software and name it ErrLog

Make some posts then open this file to see if the software has written anything onto it.

You have mentioned 2 images were uploaded. Were they properly made in the posts? Now when you try to post, how far it goes?

Regards,  
Carty..

Hi

It seems images from Amazon works just fine. I will do the log and see what happens.

Install dir is that CartyStudios Corporation ? Or should it be in data folder?  
As I have nothing named Install as far as I can tell.

This problem is still unsolved sadly. It upload some images but it won't help as the software get stuck on the others. So let me know where to put the darn error file so I can start use this software ;-)

The problem is not images from the web it seems. This is what causes the problem:

As the article where software get stuck as NO Images. So what should I do?

The file is named trans.gif and not img.gif that is why it get stuck I guess?

Hi,

Can you please fix this? The problem is that the amazon image points to the file in my hard drive but not to the ftp.

Thanks

Can you tell me what version are you guys using? I thought it was fixed in Build 533 that was released recently.

Regards,  
Carty..

I also am having the same problem with the images... funny thing is, some of the posts that get stuck on "uploading images", don't have any images at all. The only code in these posts that references any

image is the one already mentioned above:

I'm thinking that maybe this could be the problem because once I removed it through "toggle code" the post went up without further delay.

Hi Carty,

I'm using build 533 and here's my recent result:

Posted to blogger:

Image file location:

`ftp://upload_site.com/public_html/autoblog/417032DC9JLSL500.jpg`

Thanks

I just fixed this issue.

Please download the file [www.WebMagnates.org/ABS-Patch.zip](http://www.WebMagnates.org/ABS-Patch.zip)

Unzip the contents into your install folder (C:\Program Files\CartyStudios Corp.WebMag..)

Then open the software, tell me how it goes.

Regards,

Thanks

That solved the YouTube problem as well for me. I have not tested the blogger images proble yet, but will do later today. But Youtube fixed makes life a lot easier.
